Module 4: Design Activity Assignmnet - UML Design

Student Grade Calculator

Parts 1-4:

Part 5:

The main purpose of the Student base class is for storing data and handling standard calculations. To fulfill assignment requirements, I created UndergradStudent and GradStudent classes to inherit from Student. Different grading scales can be used for each even though the data structures are basically the same. To make this work, the AssignGrade() method is overridden in both of the derived classes. More types of students could potentially be created as well.
